

# Random Variables

## 1 Bernoulli Random Variable

A *Bernoulli random variable* is the simplest kind of random variable. It can take on two values, 1 and 0. It takes on a 1 if an experiment with probability  $p$  resulted in success and a 0 otherwise.<sup>1</sup> Some example uses include a coin flip, a random binary digit, and whether a disk drive crashed. If  $X$  is a Bernoulli random variable, denoted<sup>2</sup>  $X \sim \text{Ber}(p)$ :

$$\text{Probability mass function: } P(X = 1) = p \quad (1)$$

$$P(X = 0) = (1 - p) \quad (2)$$

$$\text{Expectation: } \mathbb{E}[X] = p \quad (3)$$

$$\text{Variance: } \text{Var}(X) = p(1 - p) \quad (4)$$

Bernoulli random variables and *indicator variables* are two aspects of the same concept. A random variable  $I$  is an indicator variable for an event  $A$  if  $I = 1$  when  $A$  occurs and  $I = 0$  if  $A$  does not occur.  $P(I=1)=P(A)$  and  $\mathbb{E}[I]=P(A)$ . Indicator random variables are Bernoulli random variables, with  $p=P(A)$ .

## 2 Binomial Random Variable

A *binomial random variable* is random variable that represents the number of successes in  $n$  successive independent trials of a Bernoulli experiment. Some example uses include the number of heads in  $n$  coin flips, the number of disk drives that crashed in a cluster of 1000 computers, and the number of advertisements that are clicked when 40,000 are served.

If  $X$  is a Binomial random variable, we denote this  $X \sim \text{Bin}(n, p)$ , where  $p$  is the probability of success in a given trial. A binomial random variable has the following properties:<sup>3</sup>

$$\text{Probability mass function: } \begin{cases} P(X = k) = \binom{n}{k} p^k (1 - p)^{n-k} & \text{if } k \in \mathbb{N}, 0 \leq k \leq n \\ 0 & \text{otherwise} \end{cases} \quad (5)$$

$$\text{Expectation: } \mathbb{E}[X] = np \quad (6)$$

$$\text{Variance: } \text{Var}(X) = np(1 - p) \quad (7)$$

A *Bernoulli random variable* maps "success" to 1 and "failure" to 0. Support for *Bernoulli*:  $\{0, 1\}$

<sup>1</sup> The Bernoulli random variable is the simplest random variable (i.e. an *indicator* or *boolean* random variable)

<sup>2</sup> Sampling  $x$  from a distribution  $D$  can also be written  $x \sim D$ , where  $\sim$  is read as "is distributed as".

A *binomial random variable* is the number of successes in  $n$  trials. Note that  $\text{Ber}(p) = \text{Bin}(1, p)$ .

Support for *binomial*:  $\{0, 1, \dots, n\}$

<sup>3</sup> A binomial random variable is the sum of Bernoulli random variables.
